Nominal EER @ 35°C (Btu/hr/W)	11.90	11.90
Nominal EER @ 46°C (Btu/hr/W)	8.70	8.45

*Note:*  
Efficiency at 35°C is in compliance with the ESTIDAMA minimum requirement of 11.60 Btu/hr/W.

Efficiency at 46°C is in compliance with the ESMA minimum requirement of 8.10 Btu/hr/W, 7.90 Btu/hr/W and 7.50 Btu/hr/W (according to rated capacity).

### Wide Operating Range

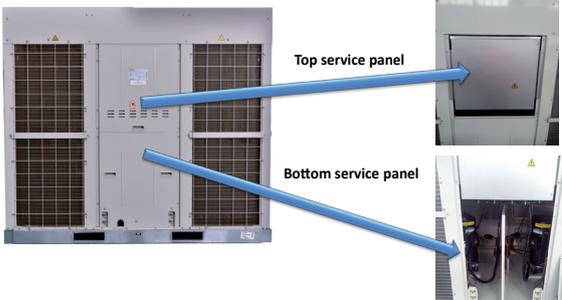

The UATQ-C series rooftops are specifically designed to deliver top performance in both standard and high ambient temperature conditions. Each unit is capable of operating continuously at an outdoor ambient of up to **52°C**.

### Lightweight and compact

The lightweight and compact design of UATQ-C series allows for ease of transportation and installation.

### Separate Service Panels

The unit is designed with two separate service panels for easy electrical box servicing.

### Independent Refrigerant Circuit

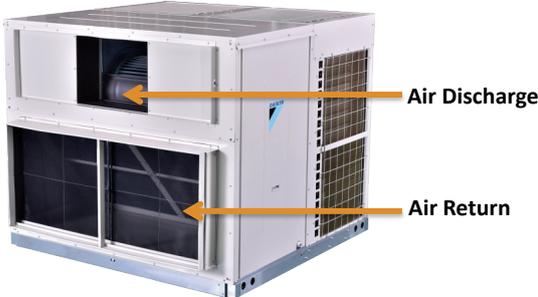

Each unit is designed with two independent refrigerant circuits, each controlled separately for maximum part load efficiency and durability.

This also allows the unit to run at part load when lower cooling capacity is required.

*\* Applicable for UATQ120C and above.*

### Air Discharge and Air Return

The UATQ-C series is available in Horizontal Air Discharge only, designed with Air discharge on the top and return air on the bottom for easy duct design.

## **Component Features**

### **Compressor**

High efficiency, low noise, and hermetically sealed SCROLL compressors are used in the UATQ-C series to give a better performance.

All compressors are equipped with an internal overload protection. Crankcase heaters are installed as standard in each compressor.

### **Evaporator Coil**

Evaporator coils are manufactured from seamless inner grooved copper tubes mechanically bonded to aluminium fins to ensure optimum heat transfer.

All coils are tested against leaks by Nitrogen holding at 609psig and highly precise Helium leak test at 235psig.

**Hydrophilic Gold Fin coating evaporator coil** is offered as standard, which could give good effects to efficient drainage of condensate water as well as heat transfer performance, and gives superior corrosion protection even in the harshest environment especially in coastal area. (960 hours Salt Spray tested)

### **Evaporator Fan**

The unit is designed with belt driven evaporator motor, allows for change of pulley on site to accommodate different static pressure and air flow requirement. This flexibility allows for wider application and offers the possibility to reach the best working conditions considering the unit's characteristics. The fan motor is **IP55 rated protection index with class B insulation class**.

### **Condenser Coil**

Condenser coils are manufactured from seamless inner grooved copper tubes mechanically bonded to aluminium fins to ensure optimum heat transfer. All coils are tested against leaks by Nitrogen holding at 609psig and highly precise Helium leak test at 235psig.

ALL standard coils are up to 3 rows / 14-16 FPI, 3/8" (9.52mm) O.D. tubes.

**Hydrophilic Gold Fin coating condenser coil** is offered as standard, which gives superior corrosion protection even in the harshest environment especially in coastal area. (960 hours Salt Spray tested)

### **Condenser Fan/Motor**

Fans are of propeller type, direct driven by weatherproof electrical induction motors. Condenser fan motors are **rated IP55 protection index with class F insulation class** and is designed with **dust proof bearing** to ensure the reliability of the motor and smooth operation all year round.

### **Casing/Structure**

The unit casing used in UATQ-C series is made of zinc coated galvanized steel sheets. It is further coated with an electrostatic powder coat, oven-baked for a tough and lasting weather resistant finish. Zinc plated screws are used to further reduce the possibility of unit rusting.

### **Coil Guard**

The condenser coil is protected by coil guard to prevent accidental damage during transportation, handling and installation.

### Refrigerant Circuit

The UATQ-C series is designed with the ability to operate at partial load depending on the requirement of the application.

*\* Applicable for UATQ120C and above.*

Each refrigerant circuit has an independent **Thermal Expansion Valve (TXV), Filter Drier and High / Low Pressure Switch.**

Additional valves are provided for site installation of Pressure Gauge and Low Ambient Kit.

### Filter

Saranet pre-filter is available as standard in the unit to prevent foreign particles entry into the unit.

A 2" filter rail is installed in the unit to accommodate additional site installed filter.

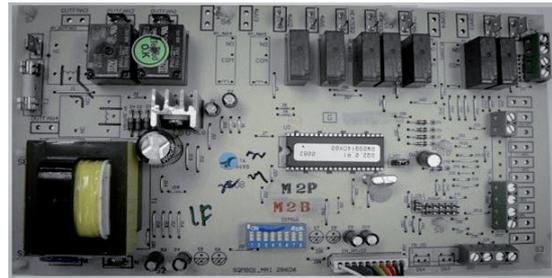

### Phase Sequential Protection

The Phase Sequential Protector is a three phase line monitor module that protects the unit components against phase loss, phase reversal and phase unbalance. It is designed to protect compressors from reverse rotation. The onboard LED indicators indicates the ON and FAULT status.

### Microprocessor Based Control

The control system consists of a microprocessor controller and a user interface remote controller. The controller offers the following features:

- Built in anti recycle timer to prevent compressor short cycling
- Sequential control of compressor, condenser motor and evaporator motor
- Intelligent control to ensure balance usage of compressor in the system
- Auto random restart and memory backup of last setting in case of interrupted power supply
- Energy saving function
- Sensor fault indication

### Wired Control Panel

The control panel is protected by a panel cover to prevent nuisance changes by unauthorized personnel.

With the remote wired controller connected, the following features can be performed:

- Temperature setting
- 7 days programmable timer
- Error indication on the remote controller for easy troubleshooting

## Drive Package

The following are the design requirements for UATQ60C unit:																																
<b>Model:</b>	<b>UATQ60C</b>																															
Supply Air Quantity	= 2000 CFM																															
External Static Pressure	= 280 Pa																															
Step 1:	From the fan curve (at 2000 CFM for standard operating system), Internal Static Pressure = <b>135</b> Pa																															
Step 2:	Therefore at 2000 CFM and 250 Pa external static pressure, Total Static Pressure = 135 + 280 Pa = <b>415</b> Pa																															
Step 3:	<p>From the blower curve, the design requirement calls for fan speed at about 1380 RPM. The new operating point is beyond the capability of original 0.75kW motor so it has to be replaced by 1.1kW motor.</p> <p>From the table:</p> <table> <tr> <td>Motor pulley</td> <td>=</td> <td>100</td> <td>mm</td> <td></td> </tr> <tr> <td>Blower pulley</td> <td>=</td> <td>140</td> <td>mm</td> <td></td> </tr> <tr> <td>Motor RPM</td> <td>=</td> <td>1445</td> <td></td> <td>(Take 1.1kW motor data)</td> </tr> </table> <p>In order to obtain 1380 RPM, we calculate the new blower pulley as: (while maintaining the motor pulley)</p> <table> <tr> <td>New blower pulley</td> <td>=</td> <td>100 x (1445 / 1380)</td> <td></td> </tr> <tr> <td></td> <td>=</td> <td>104.7</td> <td>mm</td> </tr> </table> <p>Let us take close approximation of 106 mm diameter pulley size</p> <p>Recheck, with <b>Db = 106 mm</b></p> <table> <tr> <td>Blower pulley</td> <td>=</td> <td>1445 x (100/106)</td> <td></td> </tr> <tr> <td></td> <td>=</td> <td><b>1363 RPM</b></td> <td></td> </tr> </table> <p>We thus need to change the blower pulley from 140 mm to 106 mm in order to obtain the higher operating static pressure.</p>	Motor pulley	=	100	mm		Blower pulley	=	140	mm		Motor RPM	=	1445		(Take 1.1kW motor data)	New blower pulley	=	100 x (1445 / 1380)			=	104.7	mm	Blower pulley	=	1445 x (100/106)			=	<b>1363 RPM</b>	
Motor pulley	=	100	mm																													
Blower pulley	=	140	mm																													
Motor RPM	=	1445		(Take 1.1kW motor data)																												
New blower pulley	=	100 x (1445 / 1380)																														
	=	104.7	mm																													
Blower pulley	=	1445 x (100/106)																														
	=	<b>1363 RPM</b>																														
Step 4:	<p>When the pulley is changed, the V-belt length must be rechecked. We have for horizontal air throw configuration:</p> <table> <tr> <td>V-belt length, L</td> <td>=</td> <td>2C + 1.57 (Db + Dm)</td> <td></td> </tr> <tr> <td></td> <td>=</td> <td>(2x165) + 1.57(105+100)</td> <td></td> </tr> <tr> <td></td> <td>=</td> <td>651.9</td> <td>mm</td> </tr> </table> <p>We thus can use a belt with a length of <b>650 mm</b></p> <p>where,</p> <table> <tr> <td>C</td> <td>=</td> <td>distance between the centres of the two pulleys</td> </tr> <tr> <td>Db</td> <td>=</td> <td>diameter of blower pulley</td> </tr> <tr> <td>Dm</td> <td>=</td> <td>diameter of motor pulley</td> </tr> </table>	V-belt length, L	=	2C + 1.57 (Db + Dm)			=	(2x165) + 1.57(105+100)			=	651.9	mm	C	=	distance between the centres of the two pulleys	Db	=	diameter of blower pulley	Dm	=	diameter of motor pulley										
V-belt length, L	=	2C + 1.57 (Db + Dm)																														
	=	(2x165) + 1.57(105+100)																														
	=	651.9	mm																													
C	=	distance between the centres of the two pulleys																														
Db	=	diameter of blower pulley																														
Dm	=	diameter of motor pulley																														
Step 5:	<p>From the blower curve, we can also notice that the motor power input has maintained within the current operating range of the standard unit's motor.</p> <p><b>Summary:</b></p> <table> <tr> <td>i) Fan motor power</td> <td>=</td> <td><b>1.1</b></td> <td>kW</td> </tr> <tr> <td>ii) Blower pulley diameter</td> <td>=</td> <td><b>106</b></td> <td>mm</td> </tr> <tr> <td>iii) V-belt length</td> <td>=</td> <td><b>650</b></td> <td>mm</td> </tr> </table>	i) Fan motor power	=	<b>1.1</b>	kW	ii) Blower pulley diameter	=	<b>106</b>	mm	iii) V-belt length	=	<b>650</b>	mm																			
i) Fan motor power	=	<b>1.1</b>	kW																													
ii) Blower pulley diameter	=	<b>106</b>	mm																													
iii) V-belt length	=	<b>650</b>	mm
